

AUDIBLE PEDESTRIAN SIGNAL DS100 Series

Safety for the Visually Impaired

DS100 Series APS units improve crosswalk safety for visually impaired pedestrians. For a broad range of basic functions, the DS100 Series offers great value at reasonable cost.

- **Up to 4 Walk** “Cuckoo” & “Peep” sounds approved by Transportation Association of Canada and other North American transportation authorities.
- **Dynamic Volume Compensation** for high audibility.
- **Customized** voice messages (optional).
- **Easy Installation**—no internal adjustment required.
- **Sound Inhibit** or **Button Actuated Timer** (optional) for noise sensitive areas.

RELIABLE: Advanced electronics offers minimum power consumption and long unattended life. Most adjustments can be made without opening the case. The rugged case shields the components against the elements and the heavy duty locking swivel arm protects connecting cables from vandalism.

INTELLIGENT: *Dynamic Proportional Volume Compensation* monitors ambient noise level and adjusts output to ensure audibility of signal. Normally preset to +5 dB above ambient noise.

NOISE-FRIENDLY:

Sound Inhibit (optional) allows the audible signal to be disabled at sensitive periods, during complex traffic phases, or as required.

Button Actuated Timer (BAT) (optional) generates *WALK* sounds only when needed: Holding the *WALK* button down for 3 seconds (duration is adjustable) actuates the audible signal to trigger with the *WALK* visual signal.

CUSTOMIZED MESSAGES: Play customized messages or sounds up to 15 seconds long. Directly recordable into DS100 or Factory programmed.
